Part 1: The purpose of this website is to help users expand the possibilities of what kind of beverages they can make given the ingredients they already have at home. They can maximize the utility of what they have instead of spending more money to buy new ingredients. The target user base is primarily college students and adults who may enjoy alcoholic beverages. The website conveys information about available ingredients, possible drinks, and recipes. The website tries to be engaging by presenting users with one step of information at a time, instead of making them look through a long and complicated database of information (which could technically contain the same information as the entire website).

Part 2:
- Scroll to fill a cup in landing screen
- Click on category circle to expand to a popup of specific ingredients list
- Just keep scrolling/clicking next

Part 4: Simplifying features: I removed the search functionality and made the sizes of the category circles equal.

Part 5: Trying to figure out how APIs work and how to incorporate GET requests was confusing for me.
